Question

The interiors of many temples in the ancient Middle East needed to satisfy a precise set of acoustic demands: the sounds of chants and hymns should travel with clarity, while profound silences should be fully felt and appreciated. In a research paper, a student claims that the users of one such temple were aware of how the materials that were used within the structure could affect sound quality and that they deliberately applied this knowledge to influence how sound was experienced in the space.

Which quotation from a work by a historian would most directly support the student’s claim?

Answer

- A. “Many researchers believe that the central chamber of the temple had a high ceiling, a feature that has since become essential to the acoustic design of modern concert halls.”
- B. “The innermost room of the temple was likely among the quietest spaces in the interior of the temple.”
- C. “The acoustic environment of the temple was best suited for music that eschewed ornamentation in favor of simple melodies, harmonies, and rhythms.”
- D. “During special occasions, curtains were placed inside the temple to minimize reverberation and confine the sound to designated locations.”

Question

Although Eastern North Pacific (ENP) gray whales generally migrate between their wintering waters along the coast of Mexico and their foraging waters in the Arctic, a subset of this population—known as the Pacific Coast Feeding Group (PCFG)—forages along the coastlines of Northern California (USA) and British Columbia (Canada) instead. Interestingly, individuals in this subset reach smaller maximum sizes than other ENP whales do, despite having similar pre-maximum growth rates. Researchers hypothesize that this difference may be an adaptation to distinct resource opportunities in the PCFG foraging range.

Which finding, if true, would most directly support the researchers’ claim regarding the size of PCFG whales?

Answer

- A. The average body size of PCFG whales observed along the coasts of Northern California and British Columbia has remained relatively steady in recent decades, while the average body size of ENP whales in the main group has slightly decreased.
- B. When present along the coasts of Northern California and British Columbia, PCFG whales tend to forage in rocky kelp beds at shallow depths inaccessible to whales as large as those in the ENP main group.
- C. When foraging along the coasts of Northern California and British Columbia, PCFG whales are in closer proximity to major ports and urban populations than ENP whales in the main group are when foraging in Arctic waters.
- D. Certain crustacean prey species available along the coasts of Northern California and British Columbia where PCFG whales tend to forage are not available in the Arctic waters where ENP whales in the main group forage.

Question

Economists have demonstrated that herding—in which individuals converge on the same action by imitating the economic decisions of one or more peers—occurs among investors. Investigating whether herding also occurs among nations in matters of economic policy, Maru Etta-Nkwelle examined changes in the foreign currency reserves of emerging economies in various world regions in the years following the widespread financial crisis of 1997. Etta-Nkwelle posited that herding would manifest in regional peer countries converging on the same foreign currency accumulation rate regardless of each country’s observable circumstances. She found that Asian countries showed evidence of herding but African countries did not.

Based on the text, which finding, if true, would best account for the discrepancy Etta-Nkwelle observed?

Answer

- A. The majority of the currency held in reserves by the African countries was foreign currency, whereas the majority of the currency held in reserves by the Asian countries was domestic currency.
- B. Most of the African countries belonged to international economic unions that set individual foreign-currency accumulation policies for each member, whereas the Asian countries were largely free to set their own policies.
- C. The 1997 financial crisis resulted in immediate declines in many of the African countries’ foreign currency reserves, whereas the crisis had few short-term effects on the foreign currency reserves of most of the Asian countries.
- D. The African countries tended to accumulate a variety of foreign currencies for their reserves, whereas the Asian countries tended to favor a single foreign currency for their reserves.

Question

Four Studies of Food Choices in Various Contexts

Location	Food choices related to...	Study population	Number of participants
Canada	sports	adults	17
United States	school	children	44
India	community	adolescents and adults	94
Ghana and Kenya	food shops	adolescents	142

The table shows information from four studies about food choices people make in different contexts. According to the table, the study with the smallest number of participants involved only adults, and the study with the greatest number of participants involved _____

Which choice most effectively uses data from the table to complete the text?

Answer

- A. only children.
- B. both adolescents and adults.
- C. only adolescents.
- D. only adults.

Question

Studies have demonstrated that positive feedback enhances real-world exercise performance and exercisers’ psychological experience of physical activity. Nicole Trewick and team tested their prediction that positive feedback would produce analogous results among participants cycling on a stationary bike in a virtual reality environment. After monitoring participants’ pedaling rate and heart rate to determine the effects on their physical endurance (e.g., their ability to sustain a certain target pedaling and heart rate) of feedback (positive, negative, or neutral) delivered at regular intervals, the researchers used participants’ questionnaire responses to assess their psychological experience of the task.

Assuming participants had similar baseline fitness levels, which finding from the study, if true, would most strongly suggest that positive feedback had the predicted psychological effect but not the predicted physical effect?

Answer

- A. Compared with participants who received positive feedback, participants who received neutral feedback reported lower enjoyment of the activity on average but maintained their heart and pedaling rates for longer durations than participants who received negative feedback.
- B. Compared with participants who received positive or neutral feedback, participants who received negative feedback reported lower enjoyment of the activity on average but maintained their heart and pedaling rates for longer durations.
- C. Compared with participants who received negative feedback, participants who received neutral feedback reported similar levels of enjoyment of the activity on average but maintained their heart and pedaling rates for shorter durations than participants who received positive feedback.
- D. Compared with participants who received negative or neutral feedback, participants who received positive feedback reported greater enjoyment of the activity on average but maintained their heart and pedaling rates for approximately similar durations.

Question

Some geologists have proposed designating the period from 1950 to the present as a new geological epoch (the Anthropocene) characterized by human impact on Earth, but they have struggled to identify reliable stratigraphic markers of the epoch’s onset. Inta Dimante-Deimantovica and a research team investigated whether the initial appearance of primary microplastics—invented and mass-produced for industrial and other purposes, beginning around the middle of the twentieth century—in sedimentary layers could serve this role. The researchers analyzed European lake sediment profiles from the late eighteenth century to the present. Microplastics were present in all layers, likely because certain microplastic shapes enabled rapid downward migration. The researchers therefore concluded that _____

Which choice most logically completes the text?

Answer

- A. the lowest sedimentary layer in which microplastics are found cannot be treated as indicative of the chronological beginning of the Anthropocene.
- B. the presence of microplastics in sediment dating to the late eighteenth century casts doubt on the appropriateness of designating 1950 as the onset of the Anthropocene.
- C. microplastics are not prevalent enough in sediment to serve as a reliable sign of the human impact characteristic of the Anthropocene.
- D. using the earliest presence of microplastics as a stratigraphic marker of the beginning of the Anthropocene is likely to be viable in some locations but is not viable in Europe.

Question

Duckweed is a small freshwater plant that is often exposed to zinc pollution. Sofia Vámos and colleagues collected samples of four duckweed ecotypes (genetically and geographically distinct populations within a species), along with water from each ecotype's habitat. Hypothesizing that each ecotype is adapted to its local conditions in ways that bolster its growth and resistance to pollutants, the researchers grew each ecotype in all four water samples and with three levels of zinc (none, low, high). (The researchers did not replicate local differences in light or temperature.) They found that the ecotypes grew equally well in all four water samples and that adding zinc consistently enhanced growth, regardless of concentration, suggesting that _____

Which choice most logically completes the text?

Answer

- A. while the ecotypes are genetically and geographically distinct, those differences do not represent adaptations to local environmental conditions.
- B. there may not be significant differences in the water that each ecotype inhabits, but there are significant differences in each ecotype's resistance to zinc pollution.
- C. if each ecotype is indeed locally adapted as the researchers hypothesized, those adaptations are to other environmental conditions than the water each ecotype inhabits.
- D. although the researchers' hypothesis does not appear to be supported, this may be because the levels of zinc exposure the plants in the experiment received did not match their exposure in their natural environments.

Question

Stores often play background music to create a pleasant shopping experience. Based on a survey, Amir Manzoor found that such music was linked to reduced enjoyment among customers. Manzoor thinks that one explanation for this result is that the surveyed customers may have wanted to finish their shopping as quickly as possible. They therefore weren't focused on enjoying the experience. It's possible that background music could improve the experience of other customers whose main goal is to have a good time while they shop.

Based on the text, which research question was Manzoor's study most likely intended to answer?

Answer

- A. Does the volume of a store's background music affect how much time customers spend in the store?
- B. How does the use of background music in stores affect customers' shopping experience?
- C. Do customers spend more money when shopping for music in stores or online?
- D. What genres of music do customers prefer to listen to while they are shopping?

Question

Born in Chile in 1917, artist and ethnomusicologist Violeta Parra was a pioneer in the *nueva canción chilena* (Chilean New Song) movement that emerged in the late 1950s and then spread throughout Latin America, Portugal, and Spain as *nueva canción*. Parra traveled all over Chile compiling extensive records of authentic folk music as well as recipes, proverbs, and other facets of cultural history. These records formed the foundation for the early movement’s revival of traditional Chilean folk forms in new songs that represented modern realities of the working class and strongly advocated for social change. As the movement spread beyond Chile, the breadth of musical traditions incorporated into its foundation also expanded.

Which detail about songs associated with *nueva canción*, if true, would best illustrate the underlined claim?

Answer

- A. Many feature political commentary addressing contemporary issues that stemmed from shared experiences of European colonization in Latin American countries.
- B. Many demonstrate the stylistic influence of *corrido*, a genre of narrative songs from Mexico that had come to be characterized by political themes in the early 1800s.
- C. Many were written with parts meant to be played on the *quena*, a traditional flute used across Andean countries, including Chile.
- D. Many were produced by Argentinian artists in the late 1950s, with others by artists in additional Latin American countries first emerging soon after.

Question

Archaeologists have observed similarities in the tools, such as bidirectional blades, uncovered at the Neolithic-period Mesopotamian settlement of Çayönü Tepesi and those uncovered at roughly contemporaneous settlements elsewhere in Southwest Asia, including those in the South Levant, Central Anatolia, and Central Zagros. Although similarities in tools could be attributed to imitative behavior or trade, Nefize Ezgi Altınışik et al. found evidence of genetic affinity among the populations of Çayönü Tepesi, Central Anatolia, the South Levant, and—to a lesser extent—Central Zagros.

Information in the text best supports which statement about the finding made by Altınışik et al.?

Answer

- A. It implies that people and tools likely arrived in Çayönü Tepesi from settlements in Central Anatolia and the South Levant at an earlier time than they did from settlements in Central Zagros.
- B. It raises the possibility that similarities in the design of tools found at Neolithic settlements in Southwest Asia emerged due to population blending between those settlements.
- C. It suggests that in the Neolithic period, people in the South Levant and Central Anatolia imitated tool designs originating in Çayönü Tepesi more frequently than people in Central Zagros did.
- D. It helps explain why contemporaneous Neolithic peoples in Southwest Asia had similar tools but lacked other obvious cultural similarities.

Question

Within higher education, studying philosophy requires that students be conversant with the field’s foundational texts and historical figures. By contrast, *doing* philosophy within or beyond the academy demands the creative, self-directed application of acquired expertise to enduring questions about the nature of existence and knowledge. While both approaches engage with influential figures, those who do philosophy treat such figures as vital interlocutors who facilitate new insights rather than as ossified authorities who, though relevant to the present, primarily represent the discipline’s past.

Based on the text, which choice best describes the relationship between doing philosophy and studying philosophy?

Answer

- A. Doing philosophy helps students formulate concrete solutions to practical issues, whereas studying philosophy prioritizes engagement with historical arguments in the field.
- B. Doing philosophy involves developing novel ideas through imagined dialogue with past philosophers based on knowledge of those philosophers’ views acquired by studying philosophy.
- C. Doing philosophy requires students to challenge the ideas articulated by past philosophers, especially when these ideas are broadly accepted by other people studying philosophy.
- D. Doing philosophy represents a departure from the norms that govern scholarly inquiry, whereas studying philosophy requires conforming to these norms.

Question

Having demonstrated that the power conversion efficiency of new perovskite photovoltaic cells is nearly indistinguishable from that of cells recycled multiple times, Xun Xiao and colleagues evaluated the levelized cost of electricity (LCOE)—a measure of cost per produced electricity unit that incorporates materials acquisition costs as well as operating costs—for power plants utilizing each type of cell. With a modeled 15-year cell lifetime, the LCOE of plants using new cells was 4.99 cents per kilowatt-hour, whereas that of plants using cells recycled three times was 4.05 cents per kilowatt-hour. Moreover, the LCOE differential grew from 18.8% to 31.3% when the modeled cell lifetime was reduced by two-thirds.

Based on the text, which choice, if true, most coherently and directly accounts for the observation presented in the underlined sentence?

Answer

- A. Cells can be recycled multiple times without a significant decrease in power conversion efficiency, and thus recycling cells more frequently does not change the LCOE for plants using recycled cells.
- B. Although potentially less expensive than producing new cells, recycling cells does incur costs, and thus reducing cell lifetimes entails greater cumulative costs.
- C. Securing new cell materials is more expensive than recycling cell materials, and thus more frequent cell replacement entails greater disparity in cumulative costs.
- D. As the modeled cell lifetime decreases, plant operating costs increase, and thus the LCOE for plants using new cells diverges from that of plants using recycled cells.

Question

A social species, chickens will cry out to one another in warning if they sense a hawk or other predator nearby. But if alone, a chicken will remain silent so as not to attract the predator’s attention. Sonja Hillemacher decided to use this behavior to determine whether individual chickens possess a capacity to recognize themselves visually when reflected in a mirror (a common standard for animal intelligence). In the first condition of her study, the subject could see its reflection, but no other chickens were present. In a second condition, another chicken was visible to the subject. Hillemacher presented an image of a hawk to the subject in both conditions, reasoning that if chickens lacked a capacity for visual self-recognition, then _____

Which choice most logically completes the text?

Answer

- A. neither study condition would elicit an audible response from the subject.
- B. the subject likely would cry out a warning in both study conditions.
- C. only the first study condition would elicit an audible response from the subject.
- D. the subject would fail to distinguish its reflection from the image of the hawk.

Question

Readers sometimes divide the works of twentieth-century English author Evelyn Waugh into two periods: one consisting of his early satirical novels and the other consisting of his later, more serious—even ponderous—books. Critic Seamus Perry, however, challenges that strict division. Perry argues that Waugh’s writing didn’t change over time as much as some readers have suggested. For instance, Perry contends that some of Waugh’s earliest works, notably his biography of artist Dante Gabriel Rossetti, exhibit the earnest romanticism that would characterize Waugh’s later fiction.

Based on the text, which statement about Waugh’s works would Perry most likely agree with?

Answer

- A. Waugh’s works can appropriately be separated into two periods by their subject matter and tone.
- B. Regardless of when they were written, Waugh’s works have important similarities that transcend their differences.
- C. The earliest of Waugh’s works exhibit a satirical tone, even if that tone is more apparent in Waugh’s later works.
- D. Over time, Waugh’s works became less humorous and more focused on weightier topics.

Question

In episodes of high heat, corals expel symbiotic zooxanthellae from their tissues, leading to coral bleaching and heightened coral mortality. Some researchers have proposed a mitigation strategy of identifying, rearing, and disseminating corals that have evolved strong resistance to heat, but as Nia S. Walker et al. note, if genes conferring such resistance were exclusively advantageous, they should have already propagated through coral populations. Indeed, Walker et al. show that strongly heat-resistant corals display much less growth after heat stress than do moderately heat-resistant corals.

Based on the text, Walker et al. would most likely agree with which statement about the strategy some researchers have proposed?

Answer

- A. It would involve promoting a trait that protects corals against high heat but that is associated with reduced thriving after episodes of high heat.
- B. It would favor a trait that is advantageous now but would be disadvantageous if episodes of high heat become as infrequent as has been predicted.
- C. It would benefit corals that are frequently exposed to episodes of high heat but would harm corals that are frequently exposed to episodes of moderate heat.
- D. It would require manipulating a trait that is poorly understood and that may be linked to increased coral mortality during episodes of high heat.

Question

Pablo Picasso famously subverted the norms of traditional painting: in his cubist paintings he refused to let his expression be constrained, fragmenting objects and figures to present multiple perspectives simultaneously. Though less widely known, Picasso—who once lamented that writers of his time had “limited themselves to moving around words somewhat while respecting the syntax”—also wrote poetry that defied conventional grammar, semantic relationships, and text structure. Thus, the paintings and poems are linked in that _____

Which choice most logically completes the text?

Answer

- A. the poems present many of the same subjects as the paintings but with different thematic approaches.
- B. the poems are intended to be understood as explanations of the artistic inclinations reflected in the paintings.
- C. both types of work are characterized by the simultaneous representation of multiple points of view that Picasso is known for.
- D. both exhibit Picasso’s prioritization of creative expression over the standard rules of the art forms.

Question

In classical Greek and Roman mythology, female characters are typically cast as either villains lacking in psychological depth or passive victims who are marginal to these stories, which usually focus on the exploits of male characters. Recently, a subgenre has emerged in which writers reimagine these stories from the perspectives of their female characters, giving them agency and complex motivations. Purists argue that such efforts represent a distinctively modern tendency to impose our own values on past civilizations, obscuring those civilizations’ beliefs. Defenders of the subgenre counter that reimaginings of the myths for new cultural contexts are almost as old as the myths themselves, suggesting that _____

Which choice most logically completes the text?

Answer

- A. bringing female perspectives to the forefront is not indicative of a novel attitude regarding fidelity to Greek and Roman myths’ ideologies.
- B. modern writers’ foregrounding of female characters is chiefly motivated by a desire to counterbalance the primacy of male perspectives among earlier adaptations of Greek and Roman myths.
- C. purists are overlooking a long tradition of adapting Greek and Roman myths to focus on female characters.
- D. the complex motivations given to female characters in modern retellings of Greek and Roman myths reflect a recent shift toward psychological depth in fictional representation.

Question

Sir Gawain and the Green Knight is a circa 1400 poem written in Middle English—an archaic form of the English spoken today. Over the last several centuries, the English language has undergone such transformations in vocabulary, spelling, and grammar that most readers now rely on translations to read *Sir Gawain*. In the introduction to his 2007 translation, Simon Armitage remarks that the sonic patterns of the poem, which was written in alliterative verse (a verse form featuring extensive repetition of initial consonant sounds), are essential to its structure. Because many Modern English words begin with different sounds than their Middle English equivalents do, a strictly literal translation of *Sir Gawain* would therefore likely _____

Which choice most logically completes the text?

Answer

- A. preserve much of the original text’s meaning at the expense of other qualities that are also integral to the experience of reading the poem.
- B. appeal more to modern readers than would translations like Armitage’s that instead prioritize the original text’s sonic and structural qualities.
- C. be more faithful to the original intentions of the poem than most strictly literal translations of alliterative Middle English poems are to their originals.
- D. be preferable to modern readers who are primarily interested in learning what the poem reveals about historical conditions during the time it was originally written.

Question

The following text is adapted from William Shakespeare's 1597 play *The Tragedy of King Richard III*. Richard is reflecting on the recent arrest of his brother, the Duke of Clarence, on suspicion of treason against King Edward IV. Derby, Hastings, Buckingham, Rivers, Dorset, and Grey are also members of the English nobility.

RICHARD: I do the wrong, and first begin to brawl.

The secret mischiefs that I set [flowing]

I lay unto the grievous charge of others.

Clarence, whom I indeed have cast in darkness,

I do bewEEP to many simple [gullible people],

Namely, to Derby, Hastings, Buckingham;

And tell them 'tis the Queen and her allies

That stir the King against the Duke my brother.

Now they believe it, and withal whet me

To be revenged on Rivers, Dorset, Grey.

Which choice best describes what happens in the text?

Answer

- A. Richard describes having wept as he informed Derby, Hastings, and Buckingham that the queen and her allies convinced the king to act against Clarence, and says that the earnestness of his grief caused them to accept his version of events.
- B. Richard attributes Clarence's troubles to both his own secret plotting and the distrust of Clarence that the queen and her allies Derby, Hastings, and Buckingham have planted in the king's mind.
- C. Richard indicates that he has pretended to be aggrieved about Clarence's situation and has proclaimed it to be the fault of the queen and her allies, but in reality, he has caused the hostility the king feels toward Clarence.
- D. Richard acknowledges that his mischievous nature has spurred him to commit misdeeds in the past, including instigating enmity between the king and Clarence, but he reports that he has hitherto not lost the trust of the queen and her allies.

Question

Whistler waves are low-frequency plasma waves that on Earth are typically generated by lightning. Numerous recordings of whistler waves on Venus have led many scientists to suggest that the planet’s atmosphere is host to extensive amounts of lightning, and, in fact, Venusian whistler waves have similar energy signatures to those of whistler waves generated by lightning on Earth. The majority of Venusian whistler wave data come from two spacecraft missions—the Pioneer Venus Orbiter (PVO) and the Venus Express (VEX)—which have included few observations of other phenomena consistent with lightning occurrences (such as flashes of light), leading other scientists to suggest that _____

Which choice most logically completes the text?

Answer

- A. similarities in the energy signatures of Venusian and Earth whistler waves may reflect imprecisions in the PVO and VEX data.
- B. the purported Venusian whistler waves must actually be some other type of atmospheric activity than whistler waves.
- C. Venusian lightning has properties that make it unlikely to generate whistler waves.
- D. there are geophysical characteristics of Venus not shared with Earth that promote the generation of whistler waves.

Question

Across brown bears—omnivores with high dietary plasticity—there is wide variety in dietary mix, which may reflect genetics, local resource availability, or social learning (cubs stay with their mothers for two years or more). Evaluating these possibilities, Anne Hertel et al. analyzed 30 years of data on trophic position (indicative of dietary mix) for female brown bears. After separation, daughters, who tended to settle near their mothers, occupied the same trophic positions as their mothers for two years, but the correlation disappeared by year five. Trophic correlation with unrelated individuals in similar habitats was modest, while habitat-independent correlation with nonmaternal relatives (e.g., cousins) was no different than with unrelated individuals. These findings suggest that _____

Which choice most logically completes the text?

Answer

- A. growing dissimilarity between mothers and their daughters with regard to dietary mix may reflect changes in the resources available in maternal habitats, though social learning could also contribute to the trend.
- B. dietary mix among females may reflect a social learning effect that eventually diminishes, though environmental constraints cannot be ruled out as a contributing factor.
- C. female dietary mix is best understood as changeable and contingent on fluctuating environmental conditions rather than as the result of social learning or genetic factors.
- D. social learning and resource fluctuations may both play a role in dietary mix among females, at least temporarily, though genetic factors appear to make a significant contribution as well.

Question

Given the immense scope of space, the search for extraterrestrial life is almost necessarily concentrated on the exoplanets deemed to have the most plausible chance of success—typically, atmosphere-bearing terrestrial planets orbiting within a certain range of their stars (termed the habitable zone). Claiming that Earth experienced a long transition from single-lid to plate tectonics that accelerated the emergence and evolution of complex organisms, researchers Robert J. Stern and Taras V. Gerya hold that consideration of tectonics, an often overlooked factor, could help further narrow the search for advanced extraterrestrial species.

Based on the text, what do Stern and Gerya most likely believe about the development of complex life on exoplanets?

Answer

- A. It is more likely to occur on habitable zone planets with atmospheres and plate tectonics than on otherwise similar planets that lack plate tectonics.
- B. It is more likely to occur if habitable zone planets with atmospheres transition from single-lid to plate tectonics late in their history than if they transition early in their history.
- C. It is unlikely unless the transition from single-lid to plate tectonics occurs before the acquisition of a lasting atmosphere.
- D. It is probably more dependent on the presence of plate tectonics than on orbital distance from a host star or the presence of an atmosphere.

Question

The following text is adapted from William Shakespeare's 1598 play *Henry IV, Part 1*. King Henry is addressing several noblemen who are rumored to have been disloyal to him.

KING HENRY: My blood hath been too cold and temperate,
Unapt to stir at these indignities,
And you have found me, for accordingly
You tread upon my patience; but be sure
I will from henceforth rather be myself,
Mighty and to be fear'd, than my [disposition],
Which hath been smooth as oil, soft as young down,
And therefore lost that title of respect
Which the proud soul ne'er pays but to the proud.

Which statement best describes how King Henry presents himself in the text?

Answer

- A. He declares that he has judged the noblemen's conduct in an impartial manner, and that despite their attempts to regain his trust through professions of submissiveness, they have irrevocably lost his respect.
- B. He acknowledges to the noblemen that his tolerance of their conduct has undermined their respect for him, and he resolves to display his genuine nature, which is more forceful and compels deference.
- C. He defends his calm disposition, which he sees as fundamental to his personality, and vows to maintain his tranquil demeanor even if it causes him to lose the respect of overly proud noblemen.
- D. He concedes that he has treated the noblemen with indifference, which in part explains why they have defied him, but he asserts that their disrespectful behavior is primarily driven by their excessive pride.

Question

In the early 1970s, art historian Michael Baxandall created an approach to viewing art called the “period eye,” which explains how to look at art through the lens of its historical period. Baxandall argued that it is critical that art historians understand and communicate the original social and cultural contexts of older works of art so that it is clear what the artists intended and how the pieces would have been understood by their original viewers. Since it was first introduced, Baxandall’s period eye has significantly influenced the practice of art history.

Which statement, if true, would most strongly support the claim in the underlined sentence?

Answer

- A. Art historians working today have largely rejected the idea, common among Baxandall’s predecessors, that artists’ intentions should influence how artworks are interpreted.
- B. For some historical periods, it is difficult for art historians to reconstruct how the original viewers of artworks understood what artists’ intentions for their works were.
- C. Numerous art historians of the late twentieth century and twenty-first century have focused their scholarship on how various artworks were interpreted at the time of their creation.
- D. Many art historians working before the 1970s produced detailed analyses of the social and cultural contexts of older artworks, though few extended that approach to artworks produced in their own lifetimes.

Question

Social scientists distinguish two different categories of social trust: bonding trust and bridging trust. Bonding trust refers to trust within already existing relationships (e.g., within a family), whereas bridging trust refers to trust between different groups, often involving interactions beyond one’s immediate social circle (e.g., meeting someone at a networking event). In order to evaluate these two aspects of social trust in the United Kingdom, researchers asked participants in 2005, 2018, and 2022 to rate the level of trust they felt for people they know personally and for people they are meeting for the first time. After analyzing the data from the survey responses, the researchers concluded that the level of bonding trust in the UK _____

Which choice most effectively uses data from the graph to complete the statement?

- Answer**
- A. remained largely consistent from 2005 to 2022, whereas the level of bridging trust showed more variability from 2005 to 2022.
 - B. consistently grew from 2005 to 2022, whereas the level of bridging trust largely declined from 2005 to 2022.
 - C. was the same in 2018 as it was in 2022 but remained lower than the level of bridging trust in 2018 and 2022.
 - D. declined from 2005 to 2022 but remained higher than the level of bridging trust from 2005 to 2018.

Question

Individuals with visual impairments who want to experience a solar eclipse may be able to make use of a device that converts light into sound. The device is made up of a microcontroller board and a light sensor that measures the brightness of light shining onto the device. It also has a component called a MIDI, which allows the device to play different sounds. The device plays a high-pitched flute sound in bright light, a neutral-pitched clarinet sound in mid-range light, and a soft clicking sound in low light. After a solar eclipse starts, the sun becomes more covered and the amount of light slowly reduces. Therefore, during a solar eclipse the device will _____

Which choice most logically completes the text?

Answer

- A. play a flute sound, then a clarinet sound, and then a clicking sound.
- B. play a clicking sound, then a flute sound, and then a clarinet sound.
- C. start with fast clarinet sounds that become steadily slower.
- D. start with a soft flute sound that becomes steadily louder.

Question

In subtropical Asia, *Apis dorsata* (giant honeybee) plays an essential role in pollinating a wide variety of crops and wild plants. To study how different agricultural land covers affect the species, Rika Raffiudin and colleagues monitored the foraging activity of the bees as well as the pollen content of the honey from *A. dorsata* colonies at two sites in Indonesia: Kampar, characterized by its surrounding monoculture farms (growing a single crop), and Kerinci, a forest-agriculture site where multiple crops, including hot peppers and coffee, are grown nearby. The researchers concluded that a lack of crop variety may reduce total pollen collection by *A. dorsata*.

Which finding, if true, would most directly support the researchers’ conclusion?

Answer

- A. Pollen in honey samples from Kampar bee colonies was predominantly sourced from a single plant species, whereas pollen in honey samples from Kerinci bee colonies was sourced from multiple different plant species.
- B. In one Kerinci bee colony, a greater proportion of bees returned to their nests with pollen than returned without pollen, whereas the inverse was observed in a second Kerinci bee colony.
- C. Significantly fewer bees were observed engaging in foraging activities with the crops surrounding Kerinci than with the crops surrounding Kampar.
- D. Honey samples from Kerinci bee colonies contained significantly higher concentrations of pollen than honey samples from Kampar bee colonies did.

Question

“Banking Coal” is a 1922 poem by Jean Toomer. The poem describes a fire being lit and maintained. In the poem, the speaker praises the person who built the fire: _____

Which quotation from “Banking Coal” most effectively illustrates the claim?

Answer

- A. “I’ve seen them set to work, each in his way, / Though all with shovels and with ashes.”
- B. “Whoever it was who brought the first wood and coal / To start the Fire, did his part well.”
- C. “Sometimes the fire left alone / Would die...”
- D. “Whereupon they’d crawl in hooded night-caps / Contentedly to bed.”

Question

Belonging to neither the minimalist nor the abstract art movements but heavily influencing both, Constantin Brâncuși spent his sculpting career returning to the same few themes—a kiss, a sleeping head, and a bird in flight—each rendered in pristine, simple, almost abstract forms. Perhaps the most famous example is *Bird in Space* (1923), a tall, slender bronze sculpture that arcs upward in a manner suggestive of flight but that otherwise lacks any identifiable characteristics of a bird. Despite the seeming simplicity of his works, the exacting standards to which Brâncuși held his work meant that he produced relatively few pieces over his career. There is thus something of a disparity between _____

Which choice most logically completes the text?

Answer

- A. the nature of much of Brâncuși’s work and the abstraction of *Bird in Space*.
- B. Brâncuși’s relatively limited productivity and the diversity of his sculptures.
- C. the themes Brâncuși explored and the themes favored by artists he inspired.
- D. Brâncuși’s importance to the history of art and his total artistic output.

Question

Archaeologist Weiwei Wang and her colleagues analyzed footed grinding slabs and other food-preparation tools excavated from Óc Eo, a Southeast Asian port city that flourished between the first and sixth centuries CE. Wang and colleagues recovered microscopic remnants of turmeric and other spices from the surfaces of the tools. Turmeric is native to South Asia, more than a thousand miles west of Óc Eo, and the researchers showed that the footed grinding slabs at Óc Eo are very similar to footed grinding slabs common throughout South Asia from around 500 BCE to 300 CE. Wang and colleagues’ findings therefore indicate that there must have been a trade link, whether direct or indirect, between the two regions.

Which finding, if true, would directly weaken the conclusion about Wang and her colleagues’ findings that is presented in the text?

Answer

- A. Some of the spices recovered from Óc Eo are native to the Maluku Islands, which are located approximately 2,000 miles southeast of Óc Eo.
- B. In the first through third centuries CE, there was a significant migration of people from South Asia to Southeast Asia.
- C. Other types of artifacts originating in South Asia and dating to the first through sixth centuries CE have been found throughout Southeast Asia.
- D. The people of Óc Eo and several communities in South Asia regularly traded with people in the region that is now the Southeast Asian country of Malaysia no later than the first century CE.

Question

Mollusk shells are mainly composed of calcium carbonate, a chemical compound used in mortar and other construction materials. A research team led by Ariane da Silva Cardoso investigated pulverizing discarded Sururu mussel shells to create a substitute for fine aggregates (such as sand) in mortar mixtures. The team prepared mixtures with Sururu shell aggregate (SSA) replacing varying percentages of sand and then tested the mortars’ compressive strength on days 7 and 28 of curing. Based on their findings, the team recommended SSA substitution in relatively small proportions to avoid compromising strength.

Which choice most effectively uses data from the graph to support the researchers’ recommendation?

Answer

- A. The 10% SSA mixture’s compressive strength was greater than or approximately equal to that of the control mixture on day 7 and on day 28, but on both days the 20% and 40% SSA mixtures had less compressive strength than the control mixture did.
- B. The compressive strength of the 10% SSA mixture remained nearly the same from day 7 to day 28, while that of the 20% and 40% SSA mixtures changed substantially.
- C. The 10% SSA mixture’s compressive strength was greater than that of the control mixture on day 7, but by day 28 the 10% SSA mixture’s compressive strength had decreased while that of the control mixture had increased.
- D. The compressive strength of the 10% SSA mixture never surpassed the compressive strength measured for the control mixture on day 28.

Question

Percentages of New Year’s Resolution Makers Who Make Certain Kinds of Resolutions

Type of resolution	Age 18-29	Age 30-49	Age 50-64	Age 65+
Health and exercise	79	80	79	76
Finances	68	63	56	47
Personal relationships	63	53	58	52
Hobbies	65	53	51	45

A Pew Research Center survey conducted in January 2024 found that three out of ten US adults make at least one New Year’s resolution (a promise for the year ahead), while half of those who make a resolution make more than one. The survey asked participants what kinds of resolutions they made and separated them into several categories. The table presents percentages of people who make particular kinds of New Year’s resolutions among those who choose to make them, indexed by age bracket.

Which choice best presents a conclusion about the habits of New Year’s resolution makers that is best supported by information in the text and the table?

Answer

- A. Resolution makers between the ages of 50 and 64 are more likely to make resolutions related to personal relationships and less likely to make resolutions related to finances than resolution makers between the ages of 30 and 49 are.
- B. Resolution makers between the ages of 18 and 29 are more likely to make resolutions about health and exercise than resolution makers between the ages of 30 and 49 are.
- C. The majority of US adults who make resolutions related to health and exercise also make resolutions in multiple additional categories.
- D. Among all US adults, people become less likely to make New Year’s resolutions as they age, regardless of the type of resolution.

Question

In their meta-analysis of research on advergames (video games developed to promote products or services), Zeph M.C. van Berlo et al. confirm that such games, though they can elicit player interest, may not facilitate subsequent recall of product and brand information. This phenomenon can be explained by the finite nature of cognitive capacity as it is articulated in Annie Lang’s limited capacity model of motivated mediated message processing. In this case, players’ cognitive resources are directed foremost toward the advergame’s mechanics, leaving little or no capacity for encoding and storing the information the advertiser intends to be salient.

Which choice best states the main idea of the text?

Answer

- A. The limited capacity model of motivated mediated message processing developed by Lang provides a means of explaining the finding by van Berlo et al. that players may not readily recollect the brand and product information embedded in advergames.
- B. Research by van Berlo et al. corroborates Lang’s conclusion that because people predominantly focus on game mechanics when playing video games, it is difficult for advergames to communicate brand and product information in ways that are highly memorable.
- C. The meta-analysis by van Berlo et al. reveals that higher engagement in advergame mechanics is linked to lower effectiveness in persuading players to purchase particular brands and products.
- D. Although the limited capacity model of motivated mediated message processing developed by Lang suggests otherwise, advergames can succeed as marketing tools, provided that they achieve a balance between game mechanics and the promotion of a brand or product.

Question

Microbial fuel cells (MFCs) capitalize on the ability of some species of bacteria to oxidize organic matter and transfer electrons extracellularly. The bacteria form a dense biofilm on the surface of an electron-collecting anode, but moving the electrons from the bacterial cytoplasm to an external electrode requires that the electrons pass through a series of inefficient oxidation-reduction (redox) reactions. Accordingly, MFC power output rarely exceeds a density of 0.30 milliwatts per square centimeter (mW/cm^2). In an experiment, researchers added silver nanoparticles to carbon paper covering the anode in an MFC. The resulting power density was $0.66 \text{ mW}/\text{cm}^2$. Since metals such as silver exhibit high electrical conductivity, the researchers hypothesized that _____

Which choice most logically completes the text?

Answer

- A. silver nanoparticles may allow electrons to bypass the series of redox reactions and transfer directly to the electrode.
- B. electrons may be conducted directly to the electrode before the silver nanoparticles catalyze the redox reactions.
- C. silver nanoparticles may increase the metabolic processes of the bacteria, thereby increasing the number of free electrons available to transfer to the electrode.
- D. as the density of the biofilm increases, the series of redox reactions may accelerate independent of the presence of the silver nanoparticles.

Question

Through adaptive radiation, multiple species of *Tetragnatha*—a genus of orb-weaving spiders—have significantly diversified their web architecture over a relatively short timescale. To investigate whether the material properties of *Tetragnatha* silk have been similarly affected by this evolutionary process, Angela M. Alicea-Serrano et al. examined the chemical composition of both the radial (non-sticky threads extending from the center) and capture (sticky threads that hold prey) silks that form the web as well as tested the tensile strength and viscosity of samples collected from three *Tetragnatha* species at two sites in the Hawaiian archipelago. The team found significant interspecies variation in these biomaterials.

Which choice best states the main idea of the text?

Answer

- A. Research reveals that web architecture among species of *Tetragnatha* spiders has likely diversified more rapidly than the material properties of *Tetragnatha*'s silk have.
- B. Research suggests that the material properties of silk from species of *Tetragnatha* spiders have diversified during adaptive radiation.
- C. A study indicates that variations in web architecture among species of *Tetragnatha* spiders can likely be explained by corresponding variations in the material properties of their silks.
- D. A study shows that adaptive radiation can explain interspecies variation in the web architecture of *Tetragnatha* spiders but not in the material properties of the spiders' silk.

Question

In a study of perceptions of listening ability, participants explained their position on a sociopolitical issue and then received a listener’s written summary that expressed agreement or disagreement. Within selected summaries, researchers embedded markers of attentive listening (e.g., references to specific details), hypothesizing that such indications would positively influence perceptions of listening skill even in the context of disagreement. Instead, participants consistently rated listeners who expressed disagreement as less skilled, regardless of the other traits of the listeners’ summaries.

What does the text most strongly imply about how participants responded to expressions of disagreement?

Answer

- A. When participants felt personally invested in the topics they discussed, they were less likely to perceive listeners who expressed disagreement as attentive, regardless of evidence to the contrary in these listeners’ summaries.
- B. When participants encountered summaries from listeners who expressed disagreement with their views, participants tended to disregard evidence that the listeners had in fact been attentive.
- C. Although participants maintained their positions regardless of a summary’s level of detail, they tended to regard listeners who expressed disagreement as more attentive when these listeners provided more detailed summaries.
- D. Although participants were critical of expressions of disagreement, they gave higher ratings to listeners whose summaries included markers of attentiveness than to listeners whose summaries did not include these markers.

Question

Hypothesizing that reliance on smartphones for information retrieval will lead a person to incorrectly remember instances of phone-assisted retrieval as instances of retrieval from memory, researchers asked participants general-knowledge trivia questions, instructing them to answer certain questions using only their smartphone and other questions using only their memory. When surveyed a week later, participants exhibited higher levels of misattribution for answers retrieved in the smartphone condition than for those retrieved in the memory condition, a finding that the researchers claimed supported their hypothesis.

Which question would be most useful to answer in determining the validity of the researchers’ claim as it is presented in the text?

Answer

- A. Were participants as likely to remember the source of their information when asked a week later as they would have been if asked immediately after answering the trivia questions?
- B. Were participants less confident about the accuracy of information they were instructed to retrieve from a smartphone than they were of that retrieved from their own memory?
- C. How likely were participants to answer all the trivia questions correctly in both the smartphone and the memory conditions?
- D. How did participants attribute information they were instructed to retrieve from a smartphone in instances when they already knew that information independently of their phone?

Question

Global Strontium Seawater Curve	
⁸⁷ Sr/ ⁸⁶ Sr	Age (Ma)
0.708980	6.20
0.709000	5.86
0.709020	5.40
0.709040	4.75
0.709060	3.00

The late Hemphillian (Hh) North American Land Mammal Age includes the subdivisions Hh3, 6.8 million years ago (Ma) to 6 Ma, and Hh4, 6 Ma to 4.75 Ma. While mammalian fossils have indicated that Florida’s Montbrook Fossil Site (MFS) and Palmetto Fauna of the Bone Valley Region (PFBV) date to Hh4, a more precise determination of the sites’ ages has proved challenging. Stephanie R. Killingsworth et al. compared average ratios of strontium-87 to strontium-86 (⁸⁷Sr/⁸⁶Sr) in fossil shark teeth from MFS and PFBV—0.709000 and 0.709028, respectively—to ⁸⁷Sr/⁸⁶Sr ratios in the global strontium seawater curve, a record that shows how ⁸⁷Sr/⁸⁶Sr ratios in seawater correspond to numerical ages and that is used to date fossils and, by extension, fossil sites. The researchers concluded that _____

Which choice most effectively uses data from the table to complete the statement?

Answer

- A. mammalian fossil evidence offers less dating precision than do ⁸⁷Sr/⁸⁶Sr ratios in fossil shark teeth and that PFBV likely was deposited closer to the Hh3-Hh4 boundary than was MFS.
- B. the average ⁸⁷Sr/⁸⁶Sr ratios in the fossil shark teeth from MFS and PFBV only partially support the site age estimates previously established through mammalian fossil evidence.
- C. the average ⁸⁷Sr/⁸⁶Sr ratios in the fossil shark teeth from MFS and PFBV resolve previous uncertainty about the sites’ relative ages by indicating that both sites were deposited contemporaneously during the late Hh.
- D. the average ⁸⁷Sr/⁸⁶Sr ratios in the fossil shark teeth from MFS and PFBV corroborate that both MFS and PFBV fall within Hh4 but suggest that PFBV was likely deposited more recently than MFS.

Question

In a 2020 study, Jian Yang et al. examined prokaryotic and fungal microbial communities in Qinghai-Tibetan Plateau lake sediment to understand the relative contributions of various factors to community assembly, or formation. They quantified the contributions of environmental pressures (variable and homogeneous selection), dispersal limitation, homogenizing dispersal, and nondominant processes. Tolerance of environmental pressures is known to be higher in fungi than in prokaryotes, which the researchers hypothesize accounts for the finding that _____

Which choice most effectively uses data from the graph to complete the statement?

Answer

- A. homogenizing dispersal contributed substantially less to fungal community assembly than variable selection did.
- B. the total number of factors that contributed to community assembly was greater for prokaryotes than for fungi.
- C. variable selection contributed substantially less to fungal community assembly than to prokaryote community assembly.
- D. the contribution of homogeneous selection to community assembly was negligible for both fungi and prokaryotes.

Question

Many linguists have claimed that the lyricism of Alexander Pushkin’s Russian novel in verse *Eugene Onegin* makes the work incapable of being faithfully translated, especially into English. The original work is written much like a long poem, featuring linguistic patterns and flourishes specific to the Russian language. Rather than striving to portray each scene of the novel literally, John Cranko, in his ballet adaptation of *Eugene Onegin*, opted to let the essence of the work’s emotions inspire the passion of the dancers. Critic Emma Golden writes that Cranko’s “choreography uses the poetry of the human body to summon the parts of Pushkin’s novel that were deemed untranslatable—its commitments to rhythm, cadence, symmetry.” It seems, then, that _____

Which choice most logically completes the text?

Answer

- A. Cranko’s loose adaptation of *Eugene Onegin* into a different medium may have preserved fundamental elements of the source material better than a strictly literal written translation of the text would have.
- B. though written works are frequently adapted into other formats, ballets are rarely considered to be faithful adaptations of texts.
- C. English is a particularly difficult language into which to translate poetic works, as its rhythms differ from those of many other languages.
- D. most critics believe that, like other English translations of *Eugene Onegin*, Cranko’s ballet adaptation fails to capture the essence of the original’s meaning.

Question

Zooarchaeologist Ophélie Lebrasseur and her team examined a fox skeleton discovered in 1991 at an archaeological site alongside artifacts of human habitation (like spear points) in central Argentina. Lebrasseur et al. determined that the fox was *Dusicyon avus*, an extinct species resembling a jackal, and radiocarbon dating placed the fox at the site at the same time as human inhabitants. (Indeed, the inhabitants may have deliberately buried the fox.) In addition, while wild foxes have a diet entirely made of meat, isotopic signatures of the skeleton’s teeth indicated that the fox’s diet, like that of the humans, was partly composed of plant material. Lebrasseur et al. therefore concluded that _____

Which choice most logically completes the text?

Answer

- A. the humans who were alive at the same time as the fox most likely ate more meat than the fox did.
- B. the fox may have been a companion animal of the humans who inhabited the site at the same time.
- C. the fox had a diet more similar to that of jackals than to that of wild foxes.
- D. the humans who were alive at the same time as the fox hunted using the spears whose points were also found at the site.

Question

The single origin hypothesis of iron metallurgy posits that the craft originated in Anatolia (West Asia) circa 2200–2000 BCE before diffusing to other parts of the world, including Africa. Some proponents of the hypothesis argue that iron production technologies first arrived in North Africa through Carthage, where the earliest evidence of ironworking dates to approximately 800–600 BCE, before these technologies spread to sub-Saharan Africa over the following centuries. However, excavation of multiple sites on the Adamawa plateau in Central Africa conducted by Étienne Zangato and Augustin Holl uncovered evidence of iron workshops that may have been in operation as late as 900–750 BCE in Gbabari and as early as 2300–1900 BCE in Ôbouï and Gbatoro. These findings suggest that _____

Which choice most logically completes the text?

Answer

- A. iron production may have developed independently and relatively simultaneously in Anatolia and parts of Central Africa.
- B. iron production technologies found in Gbabari likely derived directly from technologies transmitted from Anatolia, but those found in Ôbouï and Gbatoro did not.
- C. iron production technologies were likely transmitted from Anatolia to Central Africa via an alternate route than the one suggested by some proponents of the single origin hypothesis.
- D. iron production may have originated in Anatolia much earlier than the available evidence currently indicates.

Question

While mammals collectively exhibit the highest ratio of brain size to body size among vertebrates, a team led by paleontologist Ornella Bertrand demonstrates that for ten million years following the extinction of dinosaurs, that ratio in fact shrank for mammals as they evolved to fill newly vacated ecological niches and their bodies increased in size more rapidly than their brains. Competition for resources tends to favor intelligence and thus large, complex brains, but during this period, the abundance of resources relative to mammalian population numbers likely moderated competition and facilitated an increase in body size. Bertrand and her team reason that as population numbers swelled, competition intensified, creating conditions that _____

Which choice most logically completes the text?

Answer

- A. heightened the advantage that large body size conferred on mammals in certain ecological niches.
- B. restricted resources so drastically that mammals struggled to secure enough food to maintain large brain sizes.
- C. favored an evolutionary increase in brain size relative to body size among mammals.
- D. encouraged mammals with large brain sizes to adapt to a range of ecological niches.

Question

Online surveys are a common tool researchers use to collect information. These surveys are usually designed for use on personal computers (PCs), but more people are using smartphones to complete them than they are PCs. This shift in device usage may change how participants interact with online surveys. When researchers Jean Philippe Décieux and Philipp E. Sischka investigated, they found that PC users were more likely to multitask while taking surveys than smartphone users were, but PC users were also more likely to complete the surveys.

Which choice best states the main idea of the text?

Answer

- A. People are choosing to take online surveys on smartphones more often than they are on PCs because smartphones are convenient.
- B. Researchers are investigating why survey completion rates are higher on PCs than they are on smartphones, despite increased multitasking on PCs.
- C. Researchers prefer online surveys to other ways of collecting information because they think online survey results are more reliable.
- D. A study shows that the type of device people use to complete online surveys affects how they interact with these surveys.

Question

The presence of other individuals of the same species has been observed to mitigate stress in highly social mammals. To investigate whether this phenomenon, known as social buffering, also occurs in reptiles, researchers led by Chelsea E. Martin monitored stress responses in wild southern Pacific rattlesnakes (*Crotalus helleri*) in three experimental treatments: when alone, with a rope, and with a companion *C. helleri*. The researchers compared the percent change between baseline and peak heart rate in response to a (harmless) disturbance, with higher values indicating higher stress levels.

Which finding, if true, would most directly support the idea that social buffering occurs among *C. helleri*?

Answer

- A. The average percent change in heart rate was lower among *C. helleri* with a companion than among solitary *C. helleri* and *C. helleri* with a rope.
- B. Average peak heart rates were highest among solitary *C. helleri*, but no differences were observed in average peak heart rates between *C. helleri* with a companion and *C. helleri* with a rope.
- C. *C. helleri* with a companion displayed a lower average baseline heart rate and lower average peak heart rate than did solitary *C. helleri* or *C. helleri* with a rope.
- D. Solitary *C. helleri* had higher average baseline heart rates than did *C. helleri* in the other treatments, but the average percent change in heart rate was smaller among solitary *C. helleri* than among *C. helleri* with a companion.

Question

As juveniles, all white-necked jacobin hummingbirds display vibrantly blue head plumage; when they enter adulthood, males retain these blue feathers and most females molt to a drab green hue. However, 28% of adult female jacobins remain identical in coloration to juveniles and adult males. Based on field observations in Panama, a team of researchers reports that while adult males show a clear preference in mate selection for adult females with drab green feathers, they also engage in more antagonistic behavior toward those adult females than toward blue-feathered adult females when competing for resources. Therefore, the team hypothesizes that _____

Which choice most logically completes the text?

Answer

- A. adult male jacobins do not act antagonistically toward juvenile jacobins with blue head plumage when competing for resources.
- B. the percentage of blue-feathered females will increase until fewer than half of adult female jacobins are green-feathered.
- C. the occurrence of blue head plumage in adult female jacobins is driven by one or more factors not associated with mate attraction.
- D. coloration prevents green-feathered adult female jacobins from distinguishing between adult males and blue-feathered adult females.

Question

Text 1

Many teleost fish species are protogynous, meaning that fertile females can become fertile males. One model holds that protogyny occurs when body size confers a greater reproductive advantage on males than on females. In teleost fish, body size is irrelevant to female reproduction, but among males (which tend to be larger than females), only individuals comparatively large enough to defend territory reproduce. An individual could thus maximize its lifetime reproductive success by staying female when small and becoming male upon reaching a critical size threshold.

Text 2

Investigating protogyny in teleost fish, Alexander Goikoetxea and colleagues placed captured spotty wrasses of typical size distributions into two mixed-sex tanks. During the breeding season, they removed all males from tank 1 but none from tank 2. They observed that sexual change began in 81 percent of females in tank 1 but in no females in tank 2.

Based on the texts, which choice best explains the difference in the outcomes of the two tanks in Goikoetxea and colleagues’ experiment (Text 2) using the model presented in Text 1?

Answer

- A. Once the males were removed from tank 1, territories in the tank were undefended and thus even small females could maximize their reproductive success by becoming male and taking over those territories, whereas only the largest females in tank 2 could successfully take over territories due to the ongoing presence of males in the tank.
- B. With no males left in tank 1, females were potentially large enough to defend territory as males and thus could gain an advantage by becoming male at their current size, whereas females in tank 2 may not have been large enough to outcompete the males in the tank and thus would have greater reproductive success by remaining female.
- C. Differences in body size among the females in tank 1 became irrelevant to reproductive success once the males were removed, thereby eliminating any advantage to becoming male, whereas the ongoing presence of males in tank 2 made differences in body size among the females in that tank relevant to their reproductive success.
- D. Since all males were removed from tank 1, the females in the tank could not reproduce regardless of their size and thus some became male, whereas the presence of males in tank 2 meant that females in that tank could reproduce without first becoming male and thus they remained female.

Question

Scientists studying marine ecosystems were surprised by the extent of internal carbon recycling by red coralline algae. While some _____ of carbon was expected, the scientists found that the algae reabsorb nearly 40% of the carbon dioxide they produce during calcification processes and harness it for photosynthesis.

Which choice completes the text with the most logical and precise word or phrase?

Answer

- A. imitation
- B. supply
- C. examination
- D. reuse

Question

Guadalupe Romero Villanueva et al. conducted radiocarbon analysis of paint used in rock art at the Patagonian archaeological site Cueva Huenul 1, revealing that images of a comblike motif date to as early as 8,000 years ago, predating other paintings in the region by several millennia. The motif was subsequently reproduced multiple times at the site over the next 3,000 years, a period coinciding with extremely arid conditions and slightly negative population growth. The motif may therefore have functioned to help preserve cultural knowledge during a time of ecological and demographic stress.

Which choice best describes the function of the underlined portion in the text as a whole?

Answer

- A. It identifies a consideration that factored into an interpretation of the rock art at Cueva Huenul 1 that is presented in the text.
- B. It provides context that informs the text’s claim about why the peoples of Patagonia chose Cueva Huenul 1 as a culturally significant site.
- C. It emphasizes the historical conditions that explain why production of the painted motif described in the text abruptly ceased after 3,000 years of continued use.
- D. It explains the environmental circumstances that account for the rarity of rock art dating to the same period as the motif discussed in the text.

SAT	Reading and Writing	Craft and Structure	Text Structure and Purpose	Hard

Question

The following text is from Rachel Heng’s 2023 novel *The Great Reclamation*. Ah Boon is fishing off the coast of Singapore.

When he pulled up the nets, they contained only one kind of fish—black pomfrets, the flat diamonds of their bodies slick in the morning light. This uniformity did not surprise him; over the years, he’d learned that the waters here were temperamental. They could be relied upon for a good catch, but from time to time threw up only prawns or squid, and other times colorful varieties of fish that weren’t even supposed to be found in this region. He’d grown to accept the unpredictability, embracing it as a game to be played, like the reading of tea leaves or the grooves of a palm.

©2023 by Rachel Heng

Taken together, the three underlined portions most clearly serve which function in the text as a whole?

Answer

- A. They provide examples of what Ah Boon most frequently catches in the area.
- B. They illustrate the changeable nature of the fishing grounds where Ah Boon is.
- C. They emphasize the wide variety of sea creatures that Ah Boon has caught on this particular fishing trip.
- D. They underscore Ah Boon’s lack of surprise at seeing sea creatures that aren’t usually found in the region.

Question

Despite potential independent confirmation, the apparent detection in 2020 of phosphine (PH₃)—a gas that on Earth almost exclusively derives from biological sources—in Venus’s cloud deck remains controversial, in part because Venus is thought to be uninhabitable. To evaluate such a finding’s plausibility, William Bains et al. modeled multiple abiotic PH₃ pathways, including geochemical, atmospheric, and photochemical reactions, but none adequately explain the observed levels of PH₃. If Venusian PH₃ does exist, it would indicate insufficiencies in the current consensus on Venus’s chemistry.

Which choice best describes the overall structure of the text?

Answer

- A. It outlines recent efforts to confirm the presence of a particular gas in Venus’s atmosphere, summarizes a research team’s evaluations of those efforts’ methodological shortcomings, and then explains why that team remains skeptical of the gas’s future detection.
- B. It explains why the consensus view of a particular gas in Venus’s atmosphere has recently become controversial, expands on a scientific team’s reasons for questioning that consensus, and then suggests that future observations of Venus’s atmosphere will likely be needed to settle the controversy.
- C. It introduces an unexpected observation of a particular gas in Venus’s atmosphere, presents an effort to investigate possible mechanisms that could explain that observation, and then notes an implication of that investigation’s findings.
- D. It compares the levels of a particular gas on Venus and Earth, sketches the chemical processes that account for differences in these levels, and then addresses some of the practical challenges of studying the presence of this gas on Venus more closely.

Question

Alternative-history fiction is a subgenre of science fiction in which plots center on “what if?” questions. What if India had started the Industrial Revolution? What if Soviet cosmonauts had been first to land on the moon? Speculative counterfactuals like these can be great fodder for stories, but they’re also commonly deployed by academic historians to better understand factors influencing historical events. Well-realized and coherent alternative-history stories can thus complement historians’ speculations about the past.

Which choice best describes the function of the underlined portion in the text as a whole?

Answer

- A. It illustrates how academic historians have influenced writers of alternative-history fiction.
- B. It acknowledges counterfactual questions that academic historians have largely overlooked.
- C. It provides examples of the types of scenarios addressed in alternative-history fiction.
- D. It indicates specific ideas that were first raised by writers of alternative-history fiction and that subsequently inspired scholarship by academic historians.

Question

To produce *batik*, an Indonesian textile that originated as early as the 6th century CE, an artist creates patterns on fabric by skillfully applying wax to the surface and then dyeing it. Traditionally, the artist draws on the cloth using a *canting*, a pen-shaped tool that applies wax in fine lines or dots. To expedite this laborious process, the *cap*, a copper stamp that applies preset wax patterns, was introduced. Although the *cap* made the process of producing batiks much quicker, the *canting* is often preferred because it results in unique pieces.

Which choice best describes the overall structure of the text?

Answer

- A. It introduces a traditional type of textile, suggests that it is a variation of an even older type of textile, and then explains a significant difference in how those types of textiles are produced.
- B. It establishes how a textile production technique originated, indicates how the technique has changed over time, and then suggests that renewed interest in the original technique is growing.
- C. It presents a method of textile production, identifies two approaches to that method, and then addresses the relative advantage of each approach.
- D. It conveys admiration of a certain style of textile, emphasizes the level of skill needed to produce the textile, and then urges broader recognition of the skill involved in producing the textile.

Question

Though Chloé Zhao’s films are fictional, she incorporates real events into them in a documentary-like style and casts nonprofessional actors who reside in the places that she aims to portray. She also encourages these actors, whether they are teenagers living on the Pine Ridge Indian Reservation or adults who travel the country for work, to put as much of themselves into their roles as possible. Her approach adds powerful resonance to films that explore the highly personal experiences of place and home, and often the difficult decision to stay or leave.

Which choice best states the main purpose of the text?

Answer

- A. To argue that Chloé Zhao’s films are best understood as documentaries
- B. To discuss how Chloé Zhao’s background in documentary filmmaking has influenced her storytelling style in films
- C. To emphasize that Chloé Zhao’s decisions during the filmmaking process reinforce the themes of her films
- D. To summarize how Chloé Zhao’s style of filmmaking changed over the course of her career

Assessment	Test	Domain	Skill	Difficulty
SAT	Reading and Writing	Craft and Structure	Text Structure and Purpose	Hard

Question

Technological advances have prompted companies to increasingly rely on automation to streamline production. Armin Granulo and colleagues, however, found that for products with higher symbolic value (those viewed as contributing to individual self-expression), consumers prefer products made by humans rather than by robots, likely because human-made products are more strongly associated with uniqueness. When considering automation, therefore, companies—especially those specializing in products of symbolic value—should weigh trade-offs between efficiency gains and consumer preferences.

Which choice best describes the function of the underlined sentence in the text as a whole?

Answer

- A. It presents evidence supporting the text’s argument that consumers prefer products with high symbolic value over products with low symbolic value.
- B. It refers to a finding presented in the previous sentence to recommend that companies that value product quality reconsider automating their production processes.
- C. It illustrates the need for additional research to evaluate the claim in the previous sentence that automation affects how consumers rate product uniqueness.
- D. It emphasizes that a research finding discussed in the text has practical implications that are particularly relevant for businesses making a certain class of product.

Question

People tend to assume that being happy is the ideal emotional state and should be an ongoing aspiration; recently, however, research has suggested that it is at times beneficial to embrace negative emotions. To test whether anger can contribute to problem-solving abilities, researcher Heather Lench led an experiment in which participants were randomly assigned to view images designed to create an emotional condition—either neutral or one of anger, amusement, desire, or sadness. When asked to then solve a series of challenging puzzles, the participants in the anger condition had greater success than those in the other conditions.

Which choice best describes the function of the underlined portion in the text as a whole?

Answer

- A. It describes a general psychological tendency that the study discussed in the text was designed to explain.
- B. It explains an assumption underlying the hypothesis investigated in the study discussed in the text.
- C. It notes a generally accepted belief that is called into question by a finding of the experiment outlined in the text.
- D. It suggests a psychological basis for the behaviors of the participants in the experiment reported in the text.

Question

Typically, synthetic leather is petroleum based, but materials scientists searching for an ecologically sustainable alternative have used various bacteria that secrete linear chains of glucose, forming a dense mesh of cellulose called a pellicle, which is leatherlike except in color. The standard process for dyeing leather generates substantial wastewater and other undesirable byproducts, so adopting such a regimen would run counter to the ecological promise of the pellicle approach. To address this, Kenneth T. Walker and colleagues worked to modify *Komagataeibacter rhaeticus* bacteria to produce a pellicle with embedded pigmentation cells, thereby allowing the pellicle to “dye” itself from the inside.

Which choice best describes the function of the underlined portion in the text as a whole?

Answer

- A. To concede that the researchers’ main goal as described in the text will be challenging to achieve due to the standard coloring approach being impractical for use on a pellicle
- B. To indicate the characteristic of conventional synthetic leathers that makes those leathers poorly suited to achieve the researchers’ main goal as presented in the text
- C. To describe a consideration that led the researchers to employ an alternative approach to coloring a pellicle that allowed them to achieve their main goal as presented in the text
- D. To illustrate how the researchers adapted the pellicle approach to overcome a potential impediment to their main goal as presented in the text

Question

A team investigating frugivorous (fruit-eating) birds found that their feeding patterns vary depending on where they live within their habitat range. At the geographic boundaries of their natural range, these birds become highly selective, choosing fruits that closely match their beak size to maximize energy intake while minimizing effort. However, this fruit-selection strategy doesn’t occur at elevation boundaries (the highest and lowest altitudes of their range). In these areas, other factors, such as territorial competition among species, have a stronger influence on feeding patterns.

Which choice best states the main purpose of the text?

Answer

- A. To describe research methods that can be used to study the habitat preferences of frugivorous birds
- B. To present research findings concerning how location within a habitat affects the feeding patterns of frugivorous birds
- C. To discuss how competition among frugivorous bird species influences their habitat boundaries
- D. To explain why habitat boundaries are more important than beak size in determining the feeding patterns of frugivorous birds

Question ID: e19e8478

Assessment	Test	Domain	Skill	Difficulty

Question

Understanding juvenile sea turtles’ migratory patterns is crucial for conservation efforts. While adult sea turtles are well studied, little is known about juveniles during their oceanic stage, when they spend most of their time in the open ocean. To learn about this stage, researchers tagged and released six juvenile green sea turtles (*Chelonia mydas*) into the eastern Caribbean Sea. Their findings revealed that the majority of the turtles passively drifted with ocean currents throughout the region. However, two individuals swam against the currents, possibly in search of foraging grounds off the coast of South America.

Which choice best states the main purpose of the text?

Answer

- A. To describe successful conservation efforts for sea turtles
- B. To summarize research on an understudied stage of sea turtle development
- C. To compare the behavior of adult and juvenile sea turtles during migration
- D. To suggest reasons why some juvenile sea turtles swim against the ocean currents

SAT	Reading and Writing	Craft and Structure	Cross-Text Connections	Hard

Question

Text 1

Hycean planets are a class of exoplanets (planets outside our solar system) with oceans of liquid water—critical to supporting life—and atmospheres rich in hydrogen. Computer models have determined that for potential hycean planets, the range of the habitable zone (HZ), the distance from a star that allows a planet to retain liquid water on its surface, begins at about 1 astronomical unit (AU). In 2021, Nikku Madhusudhan et al. identified K2-18 b as a hycean candidate, noting that the planet is located right on the inner edge of the HZ.

Text 2

In a 2023 paper, Shang-Min Tsai et al. claimed that the hydrogen-rich atmospheres of K2-18 b and other hycean candidates admit wavelengths of light that cause elevated surface temperatures and increased water evaporation. Unlike earlier assessments, Tsai et al.’s calculations therefore placed the inner edge for these planets’ HZ as far out as 3.85 AU.

Based on the texts, how would Tsai et al. (Text 2) most likely respond to Madhusudhan et al.’s research, as presented in Text 1?

Answer

- A. By stating that the chemical composition of the atmosphere of the hycean candidate Madhusudhan et al. identified suggests that this planet’s surface is unlikely to harbor liquid water
- B. By maintaining that Madhusudhan et al. relied on a model whose estimates of surface temperatures on hycean candidates are likely too high
- C. By observing that unlike the hycean candidate Madhusudhan et al. discovered, most other types of planets with hydrogen-rich atmospheres are likely located within the HZ
- D. By arguing that K2-18 b and other hycean candidates are unlikely to support life because these planets are located too far from the stars they orbit

- D. outspoken

Assessment	Test	Domain	Skill	Difficulty
SAT	Reading and Writing	Craft and Structure	Cross-Text Connections	Hard

Question

Text 1 is adapted from E.M. Forster’s 1910 novel *Howards End*. Text 2 discusses *Howards End*. King’s Cross and St. Pancras are adjacent railway terminals in London from which trains travel to the countryside.

Text 1

To Margaret the station of King’s Cross had always suggested Infinity. Its very situation—withdrawn a little behind the facile splendours of St. Pancras—implied a comment on the materialism of life. Those two great arches, colourless, indifferent, shouldering between them an unlovely clock, were fit portals for some eternal adventure, whose issue might be prosperous, but would certainly not be expressed in the ordinary language of prosperity.

Text 2

The interplay between opposing ideological positions in *Howards End* is broadly articulated in the novel’s organization of geographic space. On the one hand, the modern metropolis of London represents capitalism’s emphasis on pragmatism and the accumulation of material wealth; on the other, the English countryside, accessible via King’s Cross, fosters an idealism that values tradition, authentic personal connection, and the aesthetic—what the novel calls “the infinite.”

Based on the texts, the author of Text 2 would most likely agree with which statement about King’s Cross, as it is depicted in Text 1?

Answer

- A. King’s Cross has a relatively unassuming appearance whose sharp contrast with the more aesthetically pleasing appearance of St. Pancras suggests to Margaret the ascendancy of the pragmatic capitalistic outlook among London’s inhabitants.
- B. Because it is situated at the beginning of Margaret’s journey from the city to the country, King’s Cross emblemizes the intrusion of the forces of materialism and modernity into the rural spaces that the novel associates with idealism and tradition.
- C. The austerity conveyed by King’s Cross’s appearance mirrors Margaret’s disillusionment with the prospect of having authentic connections with other people in a world that chiefly values more conventional forms of prosperity.
- D. As a point of connection between London and the countryside, King’s Cross suggests to Margaret the possibility of experiencing the intangible abundance promised by the kinds of authentic engagements that the novel’s rural spaces seem to offer.

Question

While researching a topic, a student has taken the following notes:

- Ukiyo-e woodblock prints were a popular artistic form in Japan from the 1600s through the 1800s.
- Ukiyo-e prints were produced by teams of artisans that included artists, wood-carvers, printers, and publishers.
- Sōsaku-hanga was a popular Japanese printmaking movement that emerged in the early 1900s.
- Sōsaku-hanga prioritized individual artistic expression.
- An artist working in this style typically handled all aspects of print creation, from drawing to wood carving to printing.

The student wants to contrast ukiyo-e and sōsaku-hanga production methods. Which choice most effectively uses relevant information from the notes to accomplish this goal?

Answer

- A. One notable distinction between ukiyo-e and sōsaku-hanga prints is sōsaku-hanga’s emphasis on individual artistic expression.
- B. Ukiyo-e prints were popular in Japan from the 1600s through the 1800s, while sōsaku-hanga prints emerged later, in the early 1900s.
- C. Teams of artisans produced ukiyo-e prints, whereas individual artists typically handled all aspects of sōsaku-hanga printmaking themselves.
- D. In contrast to ukiyo-e prints, sōsaku-hanga prints were produced using methods such as drawing and wood carving.

Question

Despite its great distance from Earth—it is 570 light-years away—the star Shaula is one of the brightest stars in the sky, ranking 23rd. Although not as bright as Shaula, the star Alkaid also ranks among the 50 brightest stars (40th, to be exact). _____ Alkaid’s brightness is likely due to the star’s relative proximity: Alkaid is only 100 light-years from Earth.

Which choice completes the text with the most logical transition?

Question

While researching a topic, a student has taken the following notes:

- Researchers Gwansu Kim et al. sought to explore the relationship between the brain’s ability to process natural sounds and its ability to process music.
- They used an artificial deep neural network (DNN) that models how the brain processes auditory information.
- The DNN had been trained to detect natural sounds (excluding music).
- Finding: The DNN spontaneously developed neurons that responded to music but not to other auditory stimuli.
- Conclusion: The brain’s ability to process music may arise as a by-product of natural sound processing.

The student wants to present the aim of the study. Which choice most effectively uses relevant information from the notes to accomplish this goal?

Answer

- A. In their study, the researchers evaluated whether an artificial deep neural network could model how the brain processes auditory information.
- B. By training an artificial deep neural network, the researchers aimed to establish that the brain’s ability to process natural sounds arises as a by-product of processing music.
- C. The researchers used an artificial deep neural network, which spontaneously developed neurons that responded to music but not to other auditory stimuli.
- D. Using an artificial deep neural network, the researchers sought to explore the relationship between the brain’s ability to process natural sounds and its ability to process music.

Question

While researching a topic, a student has taken the following notes:

- Suzanne K. Birner led a study analyzing rocks on the seafloor to better understand the history of Earth’s mantle.
- Rock samples were collected from two seafloor ridges.
- The researchers determined the samples’ period of formation (the Archean eon) and oxidation level (extremely low).
- High temperatures in the Archean likely caused the rocks’ low oxidation.
- Birner’s team suggests the oxidation of Earth’s mantle has remained stable over time, contrary to previous theories.
- The findings help explain the unique conditions that allowed life to develop on Earth.

The student wants to present the study’s research methods. Which choice most effectively uses relevant information from the notes to accomplish this goal?

Answer

- A. Birner led a study to better understand the history of Earth’s mantle and explain the conditions that allowed life to develop.
- B. To further analyze the origins of Earth’s unique conditions, researchers focused on rocks from the Archean eon, when Earth’s temperatures were extremely high.
- C. By studying these ancient rocks, the team aimed to challenge previous theories about changes in Earth’s mantle over time.
- D. Birner’s team analyzed the age and oxidation levels of rock samples collected from two seafloor ridges.

Question

While researching a topic, a student has taken the following notes:

- A 2024 study analyzed the facial expressions of wolves and domestic dogs.
- In the study, facial expressions were coded under 46 different facial actions.
- The “ears rotator” facial action is seen in wolves.
- Dog breeds with erect (wolf-like) ears can produce the “ears rotator” facial action.
- Dog breeds with flopped or semi-flopped (non-wolf-like) ears cannot produce the “ears rotator” facial action.

The student wants to compare dog breeds with wolf-like ears to dog breeds with non-wolf-like ears. Which choice most effectively uses relevant information from the notes to accomplish this goal?

Answer

- A. In a 2024 study, dog breeds with non-wolf-like ears were able to produce the same facial movements that wolves could.
- B. One difference between dog breeds with wolf-like ears and dog breeds without them is that wolf-like breeds cannot produce the “ears rotator” facial action.
- C. Non-wolf-like ears are flopped or semi-flopped, but wolf-like ears are different: they are erect and can produce the “ears rotator” facial action.
- D. Like wolves, dog breeds with erect ears can produce the “ears rotator” facial action, while those with flopped or semi-flopped ears cannot.

Question

While researching a topic, a student has taken the following notes:

- The nautical mile (6,076 feet) is the measure of distance used in seafaring navigation.
- A nautical mile directly correlates to one minute (1/60th of a degree) of latitude.
- The curvature of Earth affects the accurate measurement of long distances when using flat maps.
- Measuring distances with latitude and longitude coordinates takes into account Earth's curvature.
- Mariners use nautical charts marked with latitude and longitude to quickly calculate distances and positions.

The student wants to explain why nautical miles are used to measure distances in seafaring navigation. Which choice most effectively uses relevant information from the notes to accomplish this goal?

Answer

- A. Nautical miles are a measure of distance equal to one minute of latitude, which is a feature nautical charts use to calculate distances and positions.
- B. Since they directly correlate to the coordinates on nautical charts, which take into account Earth’s curvature, nautical miles are an efficient way to calculate distances at sea.
- C. Using nautical miles for navigation at sea takes Earth’s curvature into account, whereas measuring distances with latitude and longitude coordinates does not.
- D. Nautical charts use latitude and longitude to measure long distances; these charts are more accurate than flat maps for measuring distances in seafaring navigation because they account for Earth’s curvature.

Question

While researching a topic, a student has taken the following notes:

- Jacob Lawrence was a US painter best known for *The Migration Series* (1940–41).
- *The Migration Series* portrays scenes from the Great Migration of African Americans from the rural South to cities in the North and Midwest.
- The series consists of 60 colorful semiabstract paintings, numbered 1 through 60.
- The odd-numbered paintings are on display at the Phillips Collection in Washington, DC.
- The even-numbered paintings are on display at the Museum of Modern Art in New York City.
- Painting #12 depicts people buying tickets in a crowded train station.

The student wants to indicate where to go to view Painting #12 from Lawrence’s *Migration Series*. Which choice most effectively uses relevant information from the notes to accomplish this goal?

Answer

- A. Depicting a crowded train station, Painting #12 from *The Migration Series* is on display at the Museum of Modern Art in New York City.
- B. In Painting #12 and the other works of *The Migration Series*, Lawrence painted African Americans going from the rural South to cities in the North and Midwest.
- C. To view an even-numbered painting from Lawrence’s *Migration Series*, such as the one that depicts people buying train tickets, one must go to Washington, DC.
- D. The 60 colorful semiabstract paintings of Lawrence’s series can be viewed in two places: the Phillips Collection in Washington, DC, and the Museum of Modern Art in New York City.

Question

While researching a topic, a student has taken the following notes:

- Producing the nutrient-rich cyanobacterium *L. maxima* at industrial scale requires high-quality samples of *L. maxima* DNA.
- Yirlis Yadeth Pineda-Rodriguez and a team of researchers at the University of Córdoba, Colombia, evaluated the quantity and purity of *L. maxima* DNA extracted using three different DNA extraction kits.
- CTAB 2X (kit 1) had a DNA yield of 2,134 nanograms per microliter (ng/μL) and a purity ratio of 2.2.
- Pbact (kit 2) had a DNA yield of 157 ng/μL and a purity ratio of 1.6.
- Pplant (kit 3) had a DNA yield of 12.5 ng/μL and a purity ratio of 1.5.
- According to the researchers, Pbact was the most effective because it was the only one with both a sufficiently high yield and a purity rate close to the ideal of 1.8.

The student wants to emphasize the significance of a similarity between two of the kits. Which choice most effectively uses relevant information from the notes to accomplish this goal?

Answer

- A. Due to their insufficient yield or purity, CTAB 2X and Pplant were deemed by the researchers to be less effective than Pbact.
- B. Compared to CTAB 2X, which had a DNA yield of 2,134 ng/μL, both Pbact and Pplant had insufficient yields; Pplant, in particular, was ineffective due to its low yield.
- C. CTAB 2X and Pplant both had a DNA yield above 10 and a purity ratio above 1.4.
- D. With the ideal purity ratio being 1.8, CTAB 2X and Pbact were equal in purity, according to the researchers.

Question

While researching a topic, a student has taken the following notes:

- The farm-size transition hypothesis predicts that economic pressures associated with modernization result in smaller farms amalgamating into larger-scale commercial farms.
- Masters et al. (2013): The average farm size in Asia “already has or will soon begin to rise.”
- Promkhambut et al. (2023) argue that small rice farms in Thailand have adopted modern farming methods without a significant scaling-up of farm size.
- Promkhambut et al.: “The persistence of [small] rice farms [in Thailand] does not represent a ‘failure’ to modernize...or a ‘truncated’ transition—it is a *response* to modernization.”

The student wants to make and support a claim regarding the applicability of the farm-size transition hypothesis to Thailand. Which choice most effectively uses relevant information from the notes to accomplish this goal?

Answer

- A. Taken together, the studies by Masters et al. and Promkhambut et al. suggest that rice farms in Thailand have responded to the economic pressures associated with modernization by expanding in size.
- B. Masters et al. report that the average farm size “already has or will soon begin to rise” in Asia, a finding that is consistent with the farm-size transition hypothesis.
- C. The predicted shift to large-scale commercial farming may not hold true for rice farms in Thailand, where, according to Promkhambut et al., rice farms have remained small as they’ve modernized.
- D. Although the farm-size transition hypothesis may be applicable to some countries in Asia, it is inconsistent with the development of rice farming in Thailand.

Question

While researching a topic, a student has taken the following notes:

- Albert Einstein's theory of general relativity allows for potential shortcuts through spacetime.
- These hypothetical spacetime tunnels are known as wormholes.
- For matter to travel through a wormhole, it would need to have negative energy density.
- Negative energy density means that the matter would have less energy than empty space.
- Such matter has not been shown to exist.

The student wants to acknowledge a complication affecting travel through wormholes. Which choice most effectively uses relevant information from the notes to accomplish this goal?

Answer

- A. Einstein's theory of general relativity allows for potential spacetime shortcuts called wormholes but does not explain how matter with negative energy density could travel through them.
- B. For matter to travel through a wormhole, the matter would need to have less energy than empty space; such matter has not been shown to exist.
- C. The hypothetical tunnels known as wormholes would be potential shortcuts through spacetime were it not for one complication: they have less energy than empty space.
- D. For wormholes to be possible, according to Einstein's theory of general relativity, they would have to allow for potential shortcuts through spacetime.

Question

While researching a topic, a student has taken the following notes:

- Shanawdithit (1801–1829) was a Beothuk cartographer (mapmaker).
- Her maps of Newfoundland’s Beothuk Lake outline both the lake and various points around the lake where encounters between the Indigenous Beothuk people and British colonists occurred.
- Her maps are notable for depicting the experiences the Beothuk had within the landscape.
- Contemporary Potawatomi cartographer Margaret Pearce: Indigenous cartography emphasizes “experienced space, or place, as opposed to the Western convention of depicting space as universal, homogenized, and devoid of human experience.”
- Pearce: “Indigenous cartographies are as diverse as Indigenous cultures, from Hawaiian performative cartographies to Navajo verbal maps and sand paintings.”

The student wants to describe Shanawdithit’s approach and explain its significance. Which choice most effectively uses relevant information from the notes to accomplish this goal?

Answer

- A. Shanawdithit’s maps are part of a broader tradition of Indigenous cartography that, according to Pearce, ranges from “Hawaiian performative cartographies to Navajo verbal maps and sand paintings.”
- B. Shanawdithit mapped Beothuk Lake through significant encounters that occurred there, an approach described as “depicting space as universal [and] homogenized.”
- C. According to Pearce, Indigenous cartography, such as Shanawdithit’s maps of Beothuk Lake, emphasizes “experienced space, or place,” with a variety of approaches that reflect the diversity of Indigenous cultures.
- D. By depicting experiences of the Beothuk that occurred around Beothuk Lake, Shanawdithit’s maps reflect Indigenous cartography’s emphasis on “experienced space, or place” rather than the landscape alone.

Question

While researching a topic, a student has taken the following notes:

- Brass is a metal alloy composed primarily of zinc and copper.
- Alpha brass contains less than 35% zinc.
- It is more malleable than beta brass and can be manipulated at room temperature.
- Beta brass contains more than 45% zinc.
- It is harder and stronger than alpha brass but is more difficult to work with because it requires heat to manipulate.

The student wants to specify an advantage of alpha brass. Which choice most effectively uses information from the notes to accomplish this goal?

Answer

- A. As a metal alloy composed primarily of zinc and copper, alpha brass has a notable advantage over beta brass.
- B. Unlike beta brass, which requires heat to manipulate, alpha brass can be shaped at room temperature.
- C. Alpha brass contains less than 35% zinc, whereas beta brass contains more than 45% zinc.
- D. With its higher zinc content, alpha brass is a stronger material than beta brass.
